

IMS DELTAMATIC SPA

IMS Deltamatic S.p.A. – Top performance slitters with individual stations

During Converflex 2009, we are pleased to introduce our latest model of slitters with individual winding stations having combined peripheral and axial drive :

- Best for a flexible production and a wide range of materials
- Essential when the material thickness is variable
- Fully automatic thanks to many options available:
 - Web cutting and finished reels closure
 - Reel unloading and transport
 - New core preparation and restart
 - Reel packaging, labelling and robotized palletizing
 - Automatic size change according to the slitting program

These machines have been designed to slit and rewind paper, laminates, cardboard, labels and plastic films also with uneven thickness.

Their configuration with individual stations, each equipped with own motorization, offers a high quality of the wound reels and allows a full automation of the downstream process.

As option they can be integrated with an automatic positioning system for knives and counterknives which reduces downtimes when the slitting size are changed.

They can be fitted with a "turret" type or double unwinding stand.

Versions with frictioned winding shafts are also available, for specific needs.

Working speed up to	m/min	1200
Max unwinding diameter up to	mm	1800
Max diameter of the wound reel	mm	1250
Working width up to	mm	3000

IMS DELTAMATIC SPA designs and produces customized machinery for the web-converting industry.

The Headquarter is located in Calcinato, near Bergamo, where it has a large and modern factory, equipped with up-to-date tools for design, machining and manufacturing; another production factory is located in Mandello del Lario (OMM), on the Como Lake.
