

SINTEC

TRADITION AND FUTURE FOR DIEMAKERS AND PAPER CONVERTERS

In the past few years Sintec's range has expanded considerably and now includes an extremely varied range of products. From the **Sandvik** steels for dies to manual and air-operated machines for die processing; from hammers, to rubber and creasing matrixes; from the automatic **MBS**, **ADV** and **ULTRABENDER** bending machines to the CAD systems and plotters for sampling. Managing all these products requires hard work and organizational skills. Sintec has developed a flexible structure, equipped with tools that allow it to address the continuous evolution of the market and the new specific demands for advanced technology.

Today's customers require a fast, qualified and competitively priced service. To meet these needs, Sintec can rely on a streamlined sales and shipment system, with an efficient telephone and on-site support.

All this is managed by a reliable and leading-edge computer infrastructure, through which Sintec can provide its complete online catalogue, which is also on the Web. CONVERFLEX 2009 is a great showcase as well as a meeting point for our customers, who have the opportunity to see and try the new machines and the most advanced product for the day-to-day work of diemakers and paper converters, where we are very pleased to show our latest news, **Twister**, the new Automatic Die Cutting Machine with Rubber Knobs.
